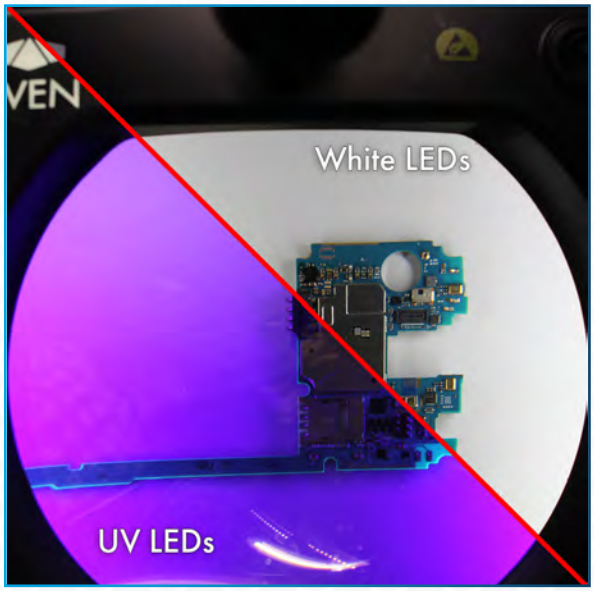
UV LED Illumination

Ultra Violet Illumination provides a different perspective on inspection. With UV lighting, hidden details can be revealed on the object of inspection, otherwise not visible with simple LED illumination. Similar to holograms on state identification cards, the details and imagery are almost completely hidden until under black-light.


This specific magnifying lamp has made itself unique and stands out from the rest because it has the advantages of both white LED and UV LED inspection. While using this lamp you can adjust the brightness and color with just a simple touch giving a variety of lighting for all uses.
